Register maps

Reading a register map · built Nov 13, 2026

Reading a register map

A register map is the contract between a controller and whatever is talking to it. These pages are the maps themselves: the address, the width, and what the value means.

Map	What it is for
TStat registers	The Modbus map of the TStat, in address order
BACnet points by controller	The object names each T3 model publishes, and how many
WireGuard registers	The registers that configure a WireGuard tunnel on a T3 ESP32 controller

The TStat map is the longest and the one support asks about most: a reading that looks wrong is usually a register read at the wrong width.
