T3000

Open Source Project · built Nov 12, 2026

Open Source Project

The T3000 front end is one of the few building automation systems on the market which is open source. Primarily the software is designed to work with Temco Controls building automation controllers and sensors but the source code is freely available and anyone can integrate devices from other manufacturers. Building owners, controls contractors and other manufacturers in the industry are encouraged to join the project and contribute to making the software more universal and more useful. You may use the project with no restrictions for both private and commercial use.

The latest compiled version of the software is here: T3000Software.zip

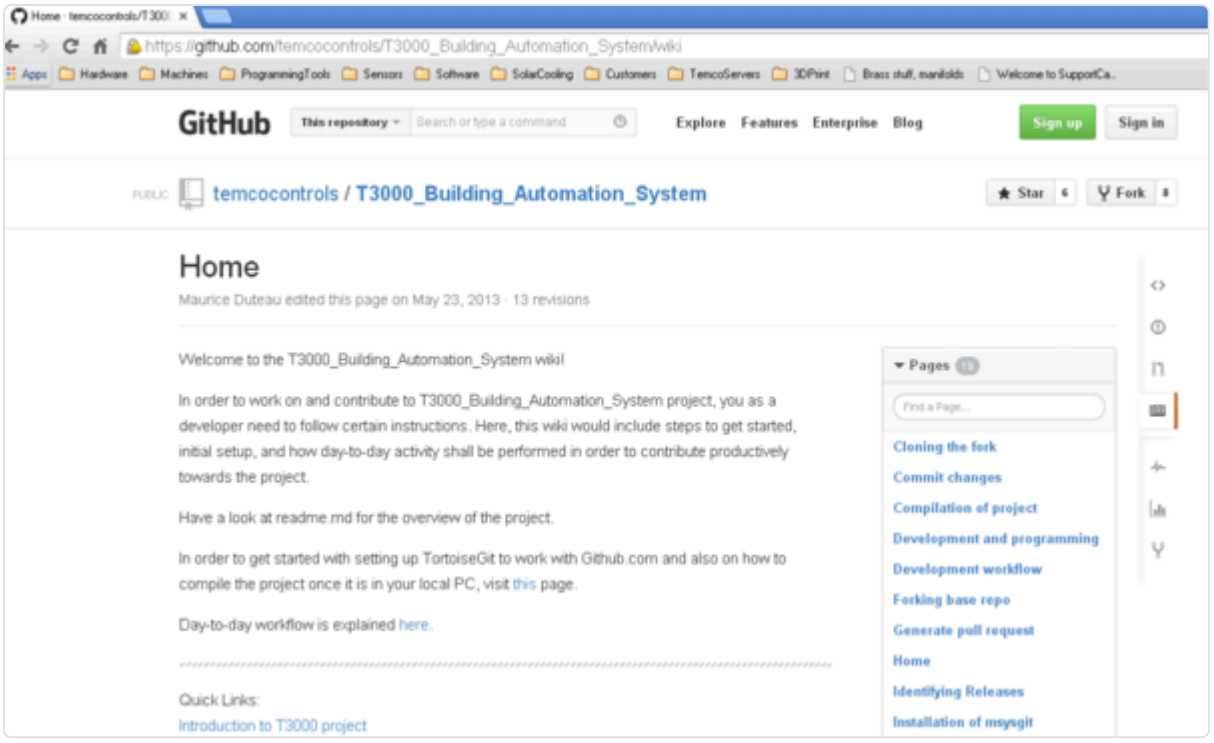

There is no signup required, the software is license free and fully functional.

The source code is hosted on the Github open source repository site: T3000 Open Source Project

This is a C++ project using Microsoft Foundation Classes.

There is another version of the T3000 project under way targeting Linux environments, it is written in C# and is also hosted on github however the project is just in the beginning stages: T3000 Cross Platform Project

Parties interested in cooperating on the projects are encouraged to contact us and we'll set you up as a contributor.

Welcome to the T3000_Building_Automation_System wiki!
In order to work on and contribute to T3000_Building_Automation_System project, you as a developer need to follow certain instructions. Here, this wiki would include steps to get started, initial setup, and how day-to-day activity shall be performed in order to contribute productively towards the project.
Have a look at readme.md for the overview of the project.
In order to get started with setting up TortoiseGit to work with Github.com and also on how to compile the project once it is in your local PC, visit this page.
Day-to-day workflow is explained here.
